

## **Cotton Production: Efficient Irrigation Methods Reduce Water Consumption**

Bremen, 3 February 2017. Cotton is produced in around 80 countries worldwide on an average of 33 million hectares, or 2.5 % of the world's arable land. Cotton is one of the most important crops in the world, alongside cereals and soya beans. More than 250 million people around the world live from cotton farming.

Agriculture always leaves behind traces in the environment but many years ago, the cotton industry already started to keep these traces as minimal as possible. With success. So, does cotton consume a lot of water? The answer is no, because much has happened here.

*Cotton Field*

No living creature can exist without water and plants also need water to grow. Experts know that cotton is even a drought- and heat-tolerant crop. Only in the rearing phase does it need sufficient irrigation. In the growth and flowering phase, on the other hand, it needs little additional moisture and much sunlight. To produce foodstuffs and natural fibres, agriculture consumes about 70 per cent of the water available in the world. Of this, only about 3 per cent is used in cotton production.

Around 40 per cent of the cotton crop is grown without irrigation and relies entirely on natural rainfall. The demands on water requirements are, however, very varied. They

are dependent on the region where the cotton is grown, the cultivation period, the prevailing climate, as well as the irrigation methods and production targets. Moreover, in the case of artificial irrigation, which also offers farmer higher yields, water is now regarded as a precious commodity and is used selectively in many cotton growing countries. Intelligent water consumption uses computer-controlled irrigation systems, droplet irrigation in the ground or demand-dependent furrow irrigation. This avoids water losses due to evaporation. The soil moisture is preserved by low soil cultivation and mulching.

For example: Compared to the last 20 years, American cotton farmers have been able to increase the efficiency of water consumption by about 80 percent through artificial irrigation. Australia is reporting a productivity increase in water consumption of 40 percent. Israel is also seen as a pioneer of exemplary irrigation management. Drip irrigation methods were already being used here as early as the nineteen seventies. Approximately 75 percent of cotton farmers use clarified and reprocessed water from water storage and water consumption in cotton growing has been reduced by 30 percent.

Currently, agricultural researchers are working on the development of cotton seed for plants with increased drought tolerance which still meet the quality requirements of their customers.

We are always available to answer any further questions, also in the context of an interview.

## **About the Bremen Cotton Exchange**

Based on its experience gained in over 140 years of exchange with the market, the Bremen Cotton Exchange is regarded as a recognised authority and a strong partner in the industry. Today, this not only applies to the cotton trade, spinners / weavers and service providers for the cotton industry, but also to the downstream textile and clothing industry.

The Cotton Exchange is an international arbitration body. Judgments made by the Arbitration Court of the Cotton Exchange are in accordance with the New York Convention of 1958. They are internationally recognised and therefore quickly enforceable.

In 2011, the International Cotton Association Quality and Research Centre Bremen GmbH was founded. In just a few years, the ICA Bremen, the joint venture between the Bremen Cotton Exchange and the International Cotton Association Ltd. (Liverpool), has become an international centre for cotton testing and research, quality training and certification. Bremen boasts a well-equipped laboratory, which is equipped with the latest state-of-the-art technology.

In addition, every two years, the cotton world gathers in Bremen: Together with its laboratory, the Fibre Institute Bremen (FIBRE), the Bremen Cotton Exchange hosts the International Cotton Conference, which has become the world's leading conference in the field of cotton testing. Around 600 guests from all over the world regularly travel to the Hanseatic city to attend the high-ranking sessions at the Bremen City Hall and take the opportunity to make personal business contacts.
